

RE/MAX 8 Ft. Cold Air Fan Controller Instructions

Making your balloon quieter for indoor locations can be done by purchasing a Variable Fan Speed Controller. The easiest way is to search for it on Amazon.com. They are around \$20. The Controller plugs into the power source and the balloon plugs into the outlet on the controller.

Inflate with the controller switched to FULL. Once the balloon is fully inflated switch the controller to VAR. Have the dial on HIGH and then slowly turn it back until the sound is low enough and the balloon still stays up. Normally it's where the Green and Red meet on the dial. Keep in mind that this will also dim the internal lights.
